Microscopes magnify an image by use of lens found in the eye-piece, which is also known as the ocular lens. The image is further magnified by the objective lens.Thus the magnification of a microscope is: magnification power of the eye-piece multiplied by the power of the objective lens. Example: if the eyepiece magnification is 5X and the objective lens' magnification is 10X, the image of ...

### Calculating Magnification | Introducing the Cell

The first principle to understand about parallel circuits is that the voltage is equal across all components in the circuit. This is because there are only two sets of electrically common points in a parallel circuit, and voltage measured between sets of common points must always be the same at any given time.
